

ABSTRACT OF THE DISCLOSURE

An electronic information management system includes a portable communication terminal having a data communication function, an electronic information server for storing electronic information including, e.g., document data or image data, and a printer. Each of the portable communication terminal, the electronic information server and the printer has a connection function to an internet. The portable communication terminal is connected to the internet through a radio relay device. Since a content of a bar code can be read by a scanner of the portable communication terminal so that electronic information data can be downloaded from the electronic information server or the electronic information can be printed based on the basis of the read information, desired electronic information data can be simply and rapidly obtained from the portable communication terminal, thereby improving usability.
